Patient-Doctor Contact Interval and Clinical Outcomes in Continuous Ambulatory Peritoneal Dialysis Patients.

Yi C, Guo Q, Lin J, Li J, Yu X, Yang X.

Abstract

BACKGROUND: The optimal patient-doctor contact (PDC) interval remains unknown in peritoneal dialysis (PD) patients. The aim was to investigate the association between PDC interval and clinical outcomes in continuous ambulatory PD (CAPD) patients.

METHODS: In this retrospective cohort study, CAPD patients who resided in Guangzhou city between January 2006 and December 2012 were included. According to receiver operating characteristic curve analysis, all patients were classified as high (PDC interval ≤ 2 months) and low (PDC interval > 2 months) PDC frequency groups. Biochemical data, clinical events, and clinical outcomes during the follow-up period were compared.

RESULTS: Of 433 CAPD patients, the mean age was 51.3 ± 15.7 years, 54.3% of patients were male, and 29.1% with diabetes. The median vintage of PD was 45.8 (26.3-69.1) months. Patients with high PDC frequency ($n = 233$) had better patient-survival rates (99.6, 87.7, and 76.5% vs. 92.7, 76.5, and 58.7% at 1, 3, and 5 years; $p < 0.001$), lower peritonitis rate (0.17 vs. 0.23 episodes per patient-year; $p < 0.001$), and hospitalization rate (0.49 vs. 0.67 episodes per patient-year; $p < 0.001$) than those in the low PDC frequency group ($n = 200$). After adjustment for confounders, PDC interval of no more than 2 months was independently associated with better patient survival (hazard ratio 0.60, 95% CI 0.42-0.86, $p = 0.006$).

CONCLUSION: A PDC interval of 2 months or less was associated with better clinical outcomes in CAPD patients. This indicates that a shorter PDC interval should be encouraged for them to achieve better clinical outcomes.

Patient-Doctor Contact Interval and Clinical Outcomes in Continuous Ambulatory Peritoneal Dialysis Patients.

Yi C, Guo Q, Lin J, Li J, Yu X, Yang X.

Abstract

BACKGROUND: The optimal patient-doctor contact (PDC) interval is not clear. We investigated the association between PDC interval and clinical outcomes in continuous ambulatory peritoneal dialysis (CAPD) patients.

METHODS: In this retrospective cohort study, CAPD patients who started dialysis in 2012 were included. According to receiver operating characteristic curve analysis, we defined high (PDC interval <2 months) and low (PDC interval >2 months) PDC frequency groups. High and low PDC frequency follow-up period were compared.

RESULTS: Of 433 CAPD patients, the mean age was 51.3 ± 12.5 years, and median vintage of PD was 45.8 (26.3-69.1) months. Patients in the high PDC frequency group had significantly better survival (99.6, 87.7, and 76.5% vs. 92.7, 76.5, and 58.7% at 1, 3, and 5 years, respectively; p < 0.001), and hospitalization rate (0.49 vs. 0.61 per patient-year; p < 0.001), and hospitalization rate (0.49 vs. 0.61 per patient-year; p < 0.001), and hospitalization rate (0.49 vs. 0.61 per patient-year; p < 0.001).

CONCLUSION: A PDC interval of 2 months or less was associated with better patient survival (hazard ratio 0.60, 95% CI 0.42-0.86). A shorter PDC interval should be encouraged for them to achieve better clinical outcomes.

Patient-Doctor Contact Interval and Clinical Outcomes in Continuous Ambulatory Peritoneal Dialysis Patients.

Yi C, Guo Q, Lin J, Li J, Yu X, Yang X.

Abstract**BACKGROUND:** The optimal patient-doctor contact (PDC) interval is unclear. We investigated the association between PDC interval and clinical outcomes in continuous ambulatory peritoneal dialysis (CAPD) patients.**METHODS:** In this retrospective cohort study, CAPD patients who started dialysis in 2012 were included. According to receiver operating characteristic curve analysis, high (PDC interval <2 months) and low (PDC interval >2 months) PDC frequency groups were compared.**RESULTS:** Of 433 CAPD patients, the mean age was 51.3 ± 12.5 years, and the median vintage of PD was 45.8 (26.3-69.1) months. Patients in the high (99.6, 87.7, and 76.5% vs. 92.7, 76.5, and 58.7% at 1, 3, and 5 years, respectively; $p < 0.001$), and hospitalization rate (0.49 vs. 0.60 per patient-year; $p < 0.001$) were significantly lower in the high PDC frequency group ($n = 200$). After adjustment for confounders, patients in the high PDC frequency group had a significantly lower risk of hospitalization with better patient survival (hazard ratio 0.60, 95% CI 0.42-0.84).**CONCLUSION:** A PDC interval of 2 months or less was associated with better patient survival. A shorter PDC interval should be encouraged for them to achieve better clinical outcomes.

Tight blood pressure control and risk of macrovascular and microvascular complications in type 2 diabetes: UKPDS 38

[PDF] jstor.org

UKPDS Group - *BMJ: British Medical Journal*, 1998 - JSTOR
 Objective: To determine whether tight control of blood pressure prevents macrovascular and microvascular complications in patients with type 2 diabetes. Design: Randomised controlled trial comparing tight control of blood pressure aiming at a blood pressure of 130/85 mmHg with standard control aiming at a blood pressure of 160/95 mmHg. Setting: 27 general practices in the United Kingdom. Results: Over 10 years, the tight control group had significantly lower rates of stroke, myocardial infarction, and diabetes-related complications compared with the standard control group. Conclusion: Tight control of blood pressure significantly reduces the risk of macrovascular and microvascular complications in patients with type 2 diabetes.

Classification and diagnosis of diabetes mellitus and other glucose intolerance syndromes

National Diabetes Data Group - *Diabetes*, 1979 - Am Diabetes Assoc
 Abstract A classification of diabetes and other categories of glucose intolerance based on contemporary knowledge of this heterogeneous syndrome, was developed by an international workgroup sponsored by the National Diabetes Data Group of the National Institutes of Health. The classification is based on the following criteria: 1) the presence of symptoms of diabetes, 2) the presence of hyperglycemia, and 3) the presence of glucose intolerance. The classification is as follows: 1) Diabetes mellitus, 2) Impaired glucose tolerance, and 3) Impaired fasting glucose.

Role of oxidative stress in development of complications in type 2 diabetes

JW Baynes - *Diabetes*, 1991 - Am Diabetes Assoc
 Abstract Nε-(carboxymethyl) lysine, Nε-(carboxymethyl) hydroxylysine, and other cross-link pentosidine are formed by sequential glycation and oxidation reactions of reducing sugars and proteins. These compounds, termed glycoxidation products, are highly reactive and have been shown to be cytotoxic and to induce apoptosis. They are also highly immunogenic and have been shown to be involved in the pathogenesis of atherosclerosis, Alzheimer's disease, and other chronic diseases. These compounds are also highly reactive and have been shown to be involved in the pathogenesis of atherosclerosis, Alzheimer's disease, and other chronic diseases.

β-cell deficit and increased β-cell apoptosis in humans with type 2 diabetes

AE Butler, J Janson, S Bonner-Weir, R Ritzel... - *Diabetes*, 2003 - Am Diabetes Assoc
 Abstract Type 2 diabetes is characterized by impaired insulin secretion. Some but not all studies suggest that a decrease in β-cell mass contributes to this. We examined pancreatic tissue from 124 autopsies: 91 obese cases (BMI > 27 kg/m²; 41 with type 2 diabetes, 15 with type 1 diabetes, and 35 without diabetes) and 33 lean cases (BMI < 27 kg/m²; 15 with type 2 diabetes, 15 without diabetes, and 3 without diabetes). In the obese cases, the number of β-cells was significantly lower than in the lean cases, and the number of β-cells was significantly lower in the obese cases with type 2 diabetes than in the obese cases without diabetes. The number of β-cells was significantly lower in the obese cases with type 2 diabetes than in the lean cases with type 2 diabetes. The number of β-cells was significantly lower in the obese cases with type 2 diabetes than in the lean cases without diabetes.

Review Article

Efficacy of Treatments for Infantile Spasms: A Systematic Review

J. Min Song, M. Woon Ahn, K. Jangwon Park, Ph.D., J. H. Cho, M.D., and M. Kyung Chung, Ph.D.

OBJECTIVE: This systematic review aims to evaluate the efficacy of various treatments for infantile spasms (IS) and to provide evidence-based recommendations for clinical practice. The review included all randomized controlled trials (RCTs) and observational studies published between 1980 and 2017. The search was conducted in Medline, Embase, and Cochrane databases. The primary outcome was the efficacy of treatment in terms of seizure control and developmental outcome. The secondary outcome was the adverse effects of treatment. The review included 10 RCTs and 10 observational studies. The results showed that the efficacy of treatment for IS is high, with a pooled relative risk (RR) of 1.87 (95% CI, 1.45-2.48). The most effective treatment was the combination of ACTH and vigabatrin. The adverse effects of treatment were mild and transient. The review suggests that the combination of ACTH and vigabatrin is the most effective treatment for IS. Further studies are needed to evaluate the long-term efficacy and safety of treatment for IS.

KEYWORDS: Infantile spasms, systematic review, efficacy, treatment, ACTH, vigabatrin.

INTRODUCTION: Infantile spasms (IS) is a rare form of epilepsy that begins during the first year of life. It is characterized by clusters of brief, repetitive seizures that are often associated with developmental delay. The etiology of IS is heterogeneous, but it is most commonly associated with tuberous sclerosis complex (TSC). The treatment of IS is challenging, and the efficacy of various treatments has been debated. This systematic review aims to evaluate the efficacy of various treatments for IS and to provide evidence-based recommendations for clinical practice.

RESULTS: The review included 10 RCTs and 10 observational studies. The results showed that the efficacy of treatment for IS is high, with a pooled relative risk (RR) of 1.87 (95% CI, 1.45-2.48). The most effective treatment was the combination of ACTH and vigabatrin. The adverse effects of treatment were mild and transient. The review suggests that the combination of ACTH and vigabatrin is the most effective treatment for IS. Further studies are needed to evaluate the long-term efficacy and safety of treatment for IS.

CONCLUSION: This systematic review suggests that the combination of ACTH and vigabatrin is the most effective treatment for IS. Further studies are needed to evaluate the long-term efficacy and safety of treatment for IS.

Sick Days

Sick days can make blood sugars hard to control. Here are some things you can do to speed up your recovery.

Ahead of Time

Ask your medical team about handling sick days before you get ill. Also train one or two family members or friends in blood glucose monitoring and other ways to help when you are sick.

Keep a box filled with medicines and easy-to-fix foods. If you wait until you are sick, you may not have the energy to collect all the things you need.

Good choices are:

- Milk of magnesia
- A pain reliever
- Medicine to control diarrhea
- A thermometer
- Antacids
- Suppositories for vomiting
- If you cannot eat meals, you will need about 50 grams of carbohydrate every 4 hours.

Foods you may want to keep on hand are:

- Sports drinks
- Instant cooked cereals
- Small juice containers

REVIEW ARTICLE

Efficacy of Treatments for Infantile Spasms: A Systematic Review

Ji Min Song, BPharm (Hons),* Jongsung Hahn, PharmD,† Se Hee Kim, MD,‡§ and Min Jung Chang, PhD*†

Objectives: West syndrome (also known as infantile spasm because of its main seizure type) is a rare form of epilepsy that begins during early infancy. Recent guidelines and reviews on West syndrome recommend the use of adrenocorticotropic hormone steroids, or vigabatrin, as the first-line treatment. However, West syndrome remains to be one of the most challenging epilepsies to treat. Here, we systematically reviewed the current literature obtained during the previous decade. This article provides an overview of the current treatment of infantile spasms.

Methods: PubMed and EMBASE were searched to retrieve studies on human published during 2005–2015 and to identify patients with clinical diagnosis of infantile spasms. Drug or diet treatments were used as interventions and comparators.

Results: We included 55 studies, of which 1 study was a meta-analysis, 9 were randomized controlled trials, 21 were prospective studies, and 24 were retrospective studies. Topiramate, levetiracetam, zonisamide, and sodium valproate with benzodiazepine (clonazepam or nitrazepam) were found to be potential drugs for treating West syndrome besides adrenocorticotropic hormone, steroids, and vigabatrin. Ketogenic diet and modified Atkins diet were also found to be effective.

hormone (ACTH) or vigabatrin.^{5–8} However, spasms persist in 33% to 56% of patients despite the use of these effective treatments.^{9,10} Moreover, treatments used at present vary in most institutions because of factors such as cost, adverse effect profiles, or availability of recommended drugs, indicating the need for well-designed clinical trials.⁴

Here, we systematically reviewed the efficacy of treatments for infantile spasms, including both drug and dietary treatments, by particularly focusing on new antiepileptic drugs to update the current knowledge on the disease obtained during the previous decade.

METHODS

A systematic literature search was conducted using PubMed and EMBASE databases for human studies published from January 1, 2005, to August 31, 2015. PubMed was searched using MeSH terms, including “Spasms, Infantile,” “Drug Therapy,” “Anticonvulsants,” “Diet Therapy,” “Ketogenic Diet,” “Diet, Carbohydrate-Restricted,” and “Treatment Outcome,” and other related text terms, including names of antiepileptic drugs. EMBASE

Infantile Spasms: review

He said,

The image shows a screenshot of the EndNote X8 'Find & Insert My References' dialog box. The window title is 'EndNote X8 Find & Insert My References'. At the top, there is a search input field containing the text 'diabetid' and a 'Find' button. Below the search field is a table with three columns: 'Author', 'Year', and 'Title'. The table is currently empty, and a message reads: 'To get started, enter a term in the field above to find your references and insert them into Word.' At the bottom right of the dialog, there are three buttons: 'Insert', 'Cancel', and 'Help'. At the bottom left, it says 'Library:' and at the bottom right, it says '0 items in list'.
